

While doing this project about how much top soil is needed for a new yard. I learned about dimensional analysis and how to convert units to money. I learned how to convert units such as volume to cubic yards. Estimating how much money I would need by figuring out the amount of gas money required and cost of having a truck deliver the top soil to me.

This problem has introduced real world problems into my math skills and how valuable it can be knowing these skills in order to save money.
